Introduction

For this website I thought the overall function and look should been changed. It was very confusing finding specific information and the design wasn't the best this site could be. I choose to use the colours of the logos for the overall colours used in the site. I also changed the font from what was placed in the previous midterm site.

Mallory Coleman: Designer & Developer

Design: Overall I thought the site had too much green. I also thought they were other colours in the logo that could have been used such as grey, and the yellowish brown. I also thought it would be important to add hovers over any button or nav since the current website does not have that. I thought it would make more sense to add the gallery to the home page since most home pages should have something drawing the eyes also with the content. The video makes sense to go into the about page because the video is about the TRAA itself.

Development: For the javascript I wanted the gallery lightbox to have the same colour and design look as the site itself, this is why I changed the opacity to white instead of a dark grey that other lightbox gallery had. I also wanted the X button closing the images lightbox to be big and noticeable and for this reason I added a hover colour changing.

Debuggers: I had a few problems with coming up with the names and knowing what width to have the images lightbox start, I decided that desktop would be best since the image size is used for the lightbox is too big of a picture for the desktop, and viewers using tablets or phones can

alway zoom in with their fingers but desktop cannot. First debugger I had was figuring out how to get the click to work for the image as a button instead of an actual button since for the GOT the lightbox was triggered by a button and for this javascript I wanted the lightbox reaction to happen by clicking on the image. I also had a hard time with using css because margin would not work which is why I had to use padding, top, right, left etc to get the image, and x button to appear in the center, and appealing spot. I also had a problem with knowing what size to have the image, I was deciding rather or not to make it bigger but than the image loses it quality. Last debugger I had was making that I was missing a '})" at the bottom which is why it was not doing what I wanted.
